

## Migrating Dashboards to Quicksight at a Global Online Retailer

### Background & Challenge

One of the largest global online retailers sought to improve their dashboarding capabilities. Keyrus completed a detailed Discovery & Design engagement for the health and safety department to assist them with this goal. This organization was looking for a seamless way to execute a 2000 Tableau dashboard to QuickSight migration with the overall goal to arm more employees with drill-down dashboards while not incurring significantly more costs.

### Solution

Keyrus provided specialist resources experienced in Tableau and QuickSight to run a 6-week engagement to profile each dashboard group in order to build a prototype solution reading metadata from Tableau workbooks. This solution will then translate the Tableau code and programmatically deploy a mirrored dashboard in QuickSight. Keyrus also reviewed and analyzed reports that would likely need additional attention to produce due to their unique complexity.

### Result

As a result, the organization has the building blocks of a prototype solution to automate a Tableau to QuickSight migration. In addition, a detailed project plan with detailed activities and tasks to be executed has also been delivered to the customer. This project plan will guide the implementation team in deploying the Tableau to QuickSight solution and includes steps to hand over and train their internal to operate the dashboards moving forward.
